

AutoAI-Hub

From Data to Society, Democratizing Machine Learning for Everyone

AI4PEP-BRAZIL

Limited Access to AI Development

Many students, researchers, and professionals lack accessible environments to build, test, and deploy AI solutions, especially in underserved institutions and regions.

High Technical Barriers

Developing AI solutions often requires advanced knowledge of programming, machine learning pipelines, infrastructure, and model evaluation, limiting participation beyond specialized teams.

Inequality in AI Innovation

Access to advanced AI development infrastructure remains concentrated in well-resourced institutions, widening the gap between those who can experiment with AI and those who can effectively create solutions with it.

AI FOR ALL: OVERCOMING BARRIERS

Fragmented and Complex AI Workflows

Data preparation, feature engineering, model selection, evaluation, and deployment frequently depend on multiple disconnected tools, making AI development time-consuming and difficult to reproduce.

Limited Translation of Data into Real-World Solutions

Organizations and communities often have valuable data but lack the technical capacity to transform it into reliable AI applications that address real-world challenges.

AI FOR ALL: OVERCOMING BARRIERS

THE BIGGEST CHALLENGE: AI BUILT FAR FROM OUR REALITIES

Most AI solutions are designed in the Global North, often without understanding the realities of the Global South - overlooking our local contexts, cultures, inequalities, resource constraints, and community needs.

OUR UNIQUE APPROACH

OBJECTIVES

1.

To democratize access to Machine Learning (ML) techniques, allowing non-specialists to use them without the need for knowledge of programming, artificial intelligence, and other disciplines.

2.

Monitoring and predicting diseases, and supporting bioinformatics analysis to assist health scientists

3.

Combating misinformation and educating communities on the ethical and social use of AI.

OUR MAIN DREAM

AI truly for all — ensuring that every person, regardless of where they live, their financial resources, or their prior technical knowledge, has the opportunity not only to access AI, but also to understand it, create with it, and benefit from it.

We generate and organize data

Because meaningful AI starts with meaningful local data. Data lakes and structured repositories help preserve, integrate, and make our own realities visible.

We democratize AI development through AutoML

Because having data is not enough. AutoML reduces technical barriers and enables students, researchers, professionals, and organizations to transform data into reliable AI models.

BUILDING A COMPLETE AI ECOSYSTEM

We transform models into real solutions

We build usable applications, platforms, and decision-support tools that address concrete challenges in health, education, environment, and society.

We educate people to understand and create AI

Education enables communities to critically understand AI, adapt it to their contexts, and create their own solutions.

GUARACI: DIVERSE BASES. ONE PATH.

Billions+
health data records

Brazil+
A broad portrait

Guaraci is a download orchestrator : it retrieves public data from Brazil directly from each official source and delivers everything ready to use, with a web interface and fidelity to the original data. Less time searching for databases, more time researching, planning, and creating solutions for the country.

BioAutoML-FAST

Empowering Breakthroughs in Life Sciences with End-to-End Machine Learning

BioAutoML-FAST, a Feature-based Automated SysTem, is a platform that enables users to upload raw biological sequences and automatically build customised classification models for sequence annotation, or regression models to predict quantitative biological activity, such as expression strength and binding affinity, with optional external validation. The platform summarises datasets through statistical metrics and dimensionality-reduction visualisations. It also includes an extensive repository of 60 trained models spanning diverse biological problems, such as anticancer and antimicrobial peptide prediction, non-coding RNA classification, and even taste prediction.

We aim to begin Phase 2 of our experimental validation by building the largest Portuguese-language dataset of its kind, with data from more than 1,000 participants. This large-scale validation will allow us to rigorously assess the reliability and generalizability of our results before making the solution available

Public Health in the Palm of Your Hand

Japiim translates complex SUS (Brazilian public healthcare system) data into simple WhatsApp conversations. Official, fast, and accessible information for everyone.

Japiim is an Artificial Intelligence Chatbot that "weaves" connections between complex health databases across Brazil to deliver **vital information to those who need it most: you.**
